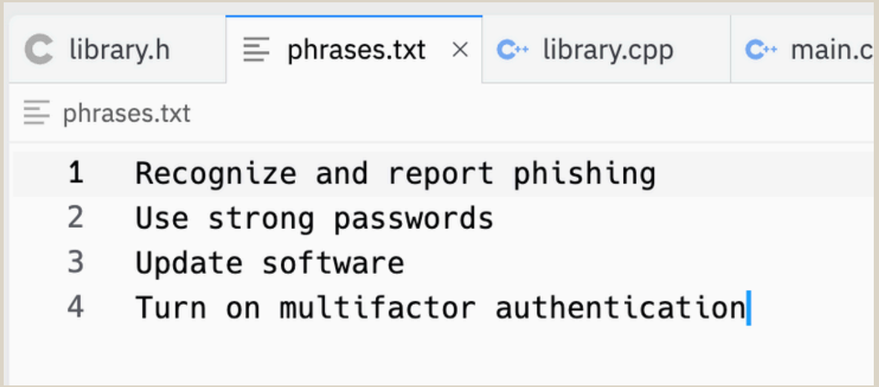
Messages to Encrypt

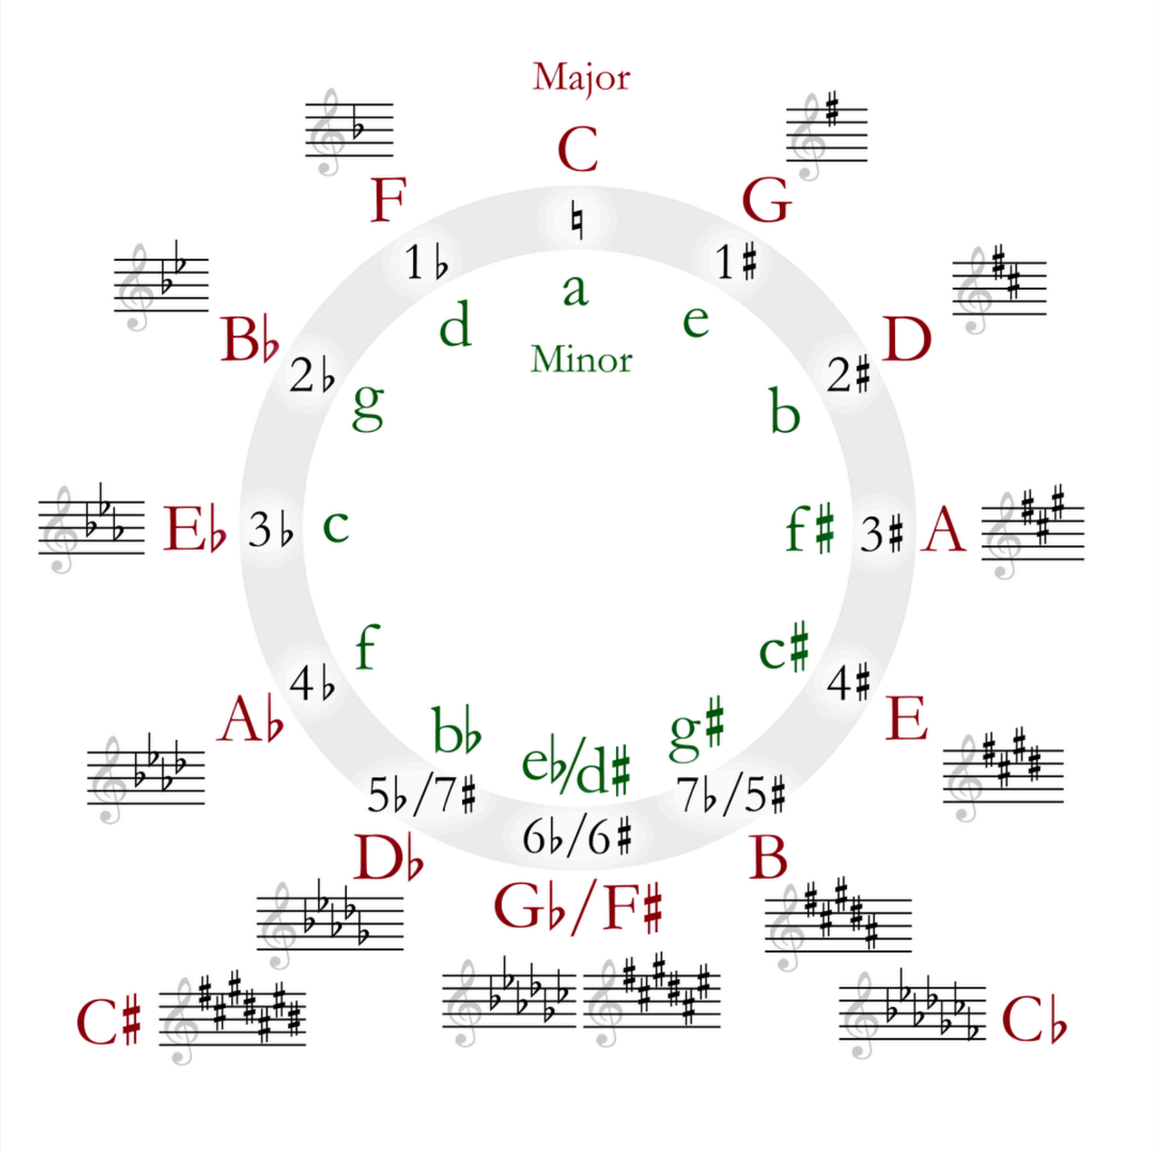


1. regonize and report phishing
2. use strong passwords
3. update software
4. turn on multifactor authentication

Encryption Rules

1. Accidentals (flats or sharps) will depend on the first letter of the phrase
    a. if the first letter of the first word in the phrase starts with the letters: A, B, C, D, E, F, G, H, I, J, K, L, M --> it will use flats
    b. if the first letter of the first word in the phrase starts with the letters: N, O, P, Q, R, S, T, U, V, W, X, Y, Z --> it will use sharps
2. The number of words in each phrase will determine the number of accidentals in the key signature
    a. if a phrase has 2 total words, it will have 2 accidentals
3. The alphabet will be repeated with each note representing a musical note A-G
    a. varying based on its placement in the alphabet
4. Each space will represent a rest

Key Signature Circle



Code

```
using namespace std;

// collect one finds put the scentence into an array.
it finds the number
// of words in the array, and the first letter of the

int num_rows;
void collect_one(ifstream &fin, Data &D) {
  string sentence,key;
  getline(fin, sentence, '.');
  D.length = sentence.length();
  for (int i = 0; i < sentence.length(); i++) {
    fin >> D.sentence[i];
  }
  for (int i = 0; i < sentence.length(); i++) {
    if (D.sentence[i] == " ") {
      D.number_of_words++;
    }
  } // end of for
  D.firstletter = D.sentence[0];
```

```
      D.number_of_words++;
    }
  } // end of for
  D.firstletter = D.sentence[0];
   key=findkey(D);
  numberofaccidentals(D,key,D.number_of_words);
